

# INSTALLATION OF HIPS FOR BORA BORA MODEL

Hips are used to cover corners and gutters. Use only one hip on every other row.

- 1) Firstly, cut the edge of the leaf at the junction to get a clean corner angle, cutting from the top rail **following along the beam and up to the start of the next row (the one just below)**. THEN, from that point cut at a 60° angle. Fix the rail to the beam.

- 2) For the other side of the same junction, cut at a 60° angle starting from the top of the rail to the end of the leaf. Fix the rail to the beam.

3) Lay a hip at the center of the vertical beam, starting at the rail. Screw the hip to the beam (minimum two screws).

# installation instruction Bora Bora

4) At junctions where hips are not required, go back to step one with the next rail.
